

# QA Process Documentation

## Testing Methodology

We perform manual testing at the end of each sprint, mostly focusing on UI validation. There is no dedicated automation framework yet, but we plan to add one in the future. Regression testing is performed only before major releases.

## Test Coverage

No formal metrics are maintained for test coverage. Testing focuses on high-level user flows and visual verification.

## Pass/Fail Criteria

- Basic sanity checks must pass.
- High-severity issues are discussed in team meetings.
- There is no formal defect severity classification.

## Team Preparedness

QA team includes 2 manual testers. No automation engineers currently assigned. Testing is done manually on staging environments.

## Risk and Mitigation

Main risks include limited automation, lack of performance testing, and manual test fatigue. No formal mitigation plan documented yet.
